I.   INTRODUCTION

J4 Courier Center a third-party courier center that allows users to freely select the variety of couriers that is available in their area where they trust theses available courier agencies to deliver and transport the package that they want to send out to a place or a person. The system has four main features and they are, *login and signup, create an arrangement, edit, and status.* Let's discuss and explained the features one by one. First off, the login and signup feature which obviously mean that the user must first create an account before logging in the application and the application will automatically read a put it in a database so that such user can now log in using the account that is created. Create Arrangement is the main feature or let's say the main part where the user must focus on because in creating an arrangement this is where the user will input all the necessary information and details so that the user can make an arrangement. Edit is basically a feature where the user can freely edit the information the he/she inputs at the first place; this feature is very reliable when it comes to correcting the data or information before confirming the arrangement. Lastly, is the *Status* feature which helps the user to identify or to keep in track of such arrangement that is made, this feature can be use by users by simple inputting the given reference number of the application.

II. FLOWCHART

A flowchart that shows the flow of the whole program or application that is shown below:
